Baby diapers - Feminine hygiene - Incontinence

“Solutions for the Hygiene Industry”

HyGen-ADL products are designed to work with your core to obtain good acquisition time and good spreading of liquid along with a balanced surface dryness.

HyGen ADL is a high-loft nonwoven produced by carding & air through bonding technology, where a combination of different fiber types are bonded by means of controlled hot air. An enhanced fluid management and superior dryness is obtained by defining the right ADL recipe depending on the core of the absorbent products.

Fast acquisition, wide spreading of liquid and acting as a buffer layer for a dry skin and comfort are the key properties of HyGen ADL products.

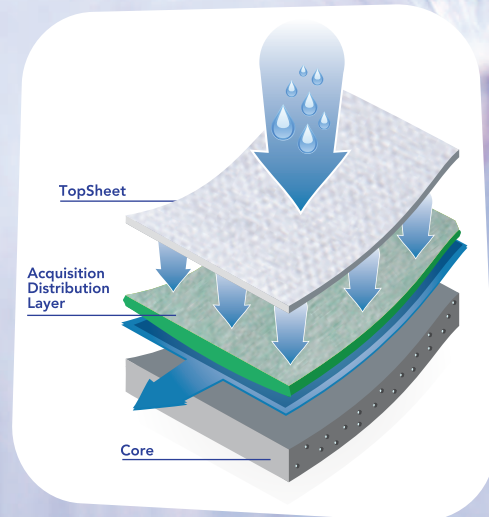

Colored HyGen-ADL allows easy visual differentiation of absorbent products and emphasizes the presence of an extra layer that is - in perception of the end user - considered to be better or higher quality product.

A more effective way of fluid management becomes necessary in case of new generation thin core or fluffless diapers. Use of a slimmer core requires use of higher grammage HyGen ADL products to compensate the reduced liquid uptake speed due to extensive use of SAP and better spreading of liquid throughout the core. High-loft and high basis weight HyGen ADL works as a barrier buffer between the wet core and top sheet to enhance skin dryness even under pressure.

It is either for baby diaper, sanitary napkin or incontinence products, HyGen brand ADL products are available in wide range of fiber mixings and basis weight to reach the most effective fluid management.
